61. **Assessing the effects of mosquito nets on malaria mortality using a space time model: a case study of Rufiji and Ifakara Health and Demographic Surveillance System sites in rural Tanzania.**

Selemani, Majige; Msengwa, Amina S; Mrema, Sigilbert; Shamte, Amri; Mahande, Michael J; Yeates, Karen; Mbago, Maurice C Y; Lutambi, Angelina M.

*Malar J*; 15(1): 257, 2016 May 04.

Article in English | MEDLINE | ID: mdl-27146674

**Abstract**

BACKGROUND: Although malaria decline has been observed in most sub-Saharan African countries, the disease still represents a significant public health burden in Tanzania. There are contradictions on the effect of ownership of at least one mosquito net at household on malaria mortality. This study presents a Bayesian modelling framework for the analysis of the effect of ownership of at least one mosquito net at household on malaria mortality with environmental factors as confounder variables. METHODS: The analysis used longitudinal data collected in Rufiji and Ifakara Health Demographic Surveillance System (HDSS) site: , respectively. Bayesian framework modelling approach using integrated in R software was used. The space time models were established to assess in malaria mortality in 58 villages in the study area. RESULTS: The results show that an increase of 10 % in ownership of mosquito nets at village level had an average of 5.2 % decrease in all age malaria deaths (IRR = 0.948, 95 % CI = 0.917, 0.977) in Rufiji HDSS and 12.1 % decrease in all age malaria deaths (IRR = 0.879, 95 % CI = 0.806, 0.959) in Ifakara HDSS. In children under 5 years, results show an average decrease in malaria mortality (IRR = 0.909, 95 % CI = 0.909, 0.982) in Rufiji HDSS. Model comparison showed that model with spatial and temporal, and with appropriate and provides useful for targeting malaria control intervention. Furthermore, ownership of mosquito nets at household showed a significant impact on malaria mortality.

☐ 1. **Spatial variations and determinants of infant and under-five mortality in Bangladesh.**

Gruebner, Oliver; Khan, Mmh; Burkart, Katrin; Lautenbach, Sven; Lakes, Tobia; Krämer, Alexander; Subramanian, S V; Galea, Sandro.

*Health Place*; 47: 156-164, 2017 Sep.

Article in English | MEDLINE | ID: mdl-28888890

**Abstract**

Reducing child mortality is a Sustainable Development Goal yet to be achieved by many low-income countries. We applied a subnational and spatial approach based on publicly available datasets and identified permanent insolvency, urbanicity, and malaria endemicity as factors associated with child mortality. We further detected spatial clusters in the east of Bangladesh and noted Sylhet and Jamalpur as those districts that need immediate attention to reduce child mortality. Our approach is transferable to other regions in comparable settings worldwide and may guide future studies to identify subnational regions in need for public health attention. Our study adds to our understanding where we may intervene to more effectively improve health, particularly among disadvantaged populations.

**Abstract**

Malaria-associate pregnancy has a significant impact on infant morbidity and mortality. The detrimental effects of malaria infection during pregnancy have been shown to correlate with immune activation in the placental tissue. Herein we sought to evaluate the effect of Toll-like receptors (TLRs) activation on placental malaria (PM) development by using the
